A subset of samples was analyzed by Forensic Analytical of Hayward, California, as laboratory project groups **2595-543** and **2595-544** for the following constituent.

- Asbestos in soil following USEPA Method 600/R-93/116 (visual area estimation by polarized light microscopy [PLM]).

Data were evaluated following the *Guidance for Evaluating Performance-Based Chemical Data* (USACE 2005), *National Functional Guidelines for Organic Data Review* (EPA 1999), *National Functional Guidelines for Inorganic Date Review* (EPA 2004), and specific criteria listed in the analytical methods.

This is an exception summary. All laboratory quality assurance results (holding time, blank sample analysis, laboratory control standard analysis, surrogate spike analysis) supplied to WESTON for the project analyses met acceptance criteria with the following exceptions.

LABORATORY GROUP 720-381-1

Metals

- Recovery of barium from the matrix spike duplicate (MSD) sample in laboratory soil preparation batch **720-1636** was less than the lower control limit. Recoveries of barium from the matrix spike (MS) sample and the laboratory control sample (LCS) met acceptance criteria. Barium results from all associated samples were qualified as estimated concentrations, unknown bias (J).
- Recoveries of mercury from the MS and MSD samples in laboratory soil preparation batch **720-1666** were each less than 10-percent. The parent sample concentration was comparable to the concentration of spike added. Recovery of mercury from the LCS met

acceptance criteria. Detected mercury results from all associated samples were qualified as estimated concentrations (J), possible low bias. Non-detected mercury results from all associated samples were rejected for use (R).

- Recovery of barium from the MSD sample in laboratory soil preparation batch **720-1734** was greater than the upper control limit. Recoveries of barium from the MS sample and the LCS met acceptance criteria. Detected barium results from all associated samples were qualified as estimated concentrations, unknown bias (J). Non-detected barium results were not qualified.
- Recovery of lead from the MSD sample in laboratory soil preparation batch **720-1734** was less than the lower control limit. Recoveries of lead from the MS sample and the LCS met acceptance criteria. Lead results from all associated samples were qualified as estimated concentrations, unknown bias (J).
- Recovery of mercury from the MSD sample in laboratory soil preparation batch **720-1737** was greater than the upper control limit. Recoveries of mercury from the MS sample and the LCS met acceptance criteria. Detected mercury results from all associated samples were qualified as estimated concentrations, unknown bias (J). Non-detected mercury results were not qualified.
- Recovery of lead from the MSD sample in laboratory soil preparation batch **720-1773** was less than the lower control limit. Recoveries of lead from the MS sample and the LCS met acceptance criteria. Lead results from all associated samples were qualified as estimated concentrations, unknown bias (J).

LABORATORY GROUP 720-413-1

- Recoveries of barium from the MS and MSD samples in laboratory soil preparation batch **720-1909** were less than the lower control limit. Recovery of barium from the LCS met acceptance criteria. Barium results from all associated samples were qualified as estimated concentrations (J), possible low bias.
- Recoveries of cadmium, lead, and selenium from the MSD sample in laboratory soil preparation batch **720-1909** were less than their respective lower control limits. Recoveries of these metals from the MS sample and the LCS met acceptance criteria. Cadmium, lead, and selenium results from all associated samples were qualified as estimated concentrations, unknown bias (J).
- Recovery of mercury from the MSD sample in laboratory soil preparation batch **720-17912** was greater than the upper control limit. The relative percent difference (RPD) between MS and MSD recoveries of mercury exceeded the acceptance criterion. Recoveries of mercury from the MS sample and the LCS met acceptance criteria. Detected mercury results from all associated samples were qualified as estimated concentrations (J), possible high bias. Non-detected mercury results were not qualified.

1.1 OTHER DATA QUALIFICATION

Apparent diesel-range detections could not be evaluated to determine their origin (i.e., anthropogenic versus naturally-occurring), since chromatograms and quantitation reports were not provided by the laboratory.

All analytical results below the laboratory quantitation limits (RL) have been reported by the laboratory as not-detected at the RL concentrations.

No other data were qualified for this review.

2. DATA QUALIFIERS

Any data qualifiers applied by the laboratory have been removed from the data summary sheets and superceded by data validation qualifiers as follow.

The following qualifiers were used to modify the data quality and usefulness of individual analytical results.

- < - The analyte was not detected at the given quantitation (reporting) limit.
- J - The analyte was positively identified and detected; however, the concentration is an estimated value because quality control criteria were not met.
- R - Data are rejected due to significant exceedance(s) of quality control criteria. The analyte may or may not be present. The associated analyte result is unusable for any purpose.

3. DATA ASSESSMENT

Data review was performed by an experienced quality assurance chemist independent of the analytical laboratory and not directly involved in the project.

This is to certify that I have examined the analytical data and, based on the information provided to me by the laboratory, and in my professional judgment, the data as qualified are ACCEPTABLE for uses specified in the project QAPP.

Rejected analyte results may not be used for any purpose.
